Cybersecurity Incident Report: Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The browser tried to contact the DNS server over UDP to resolve **yummyrecipesforme.com**. The server replied with an ICMP error, "UDP port 53 unreachable," indicating DNS traffic couldn't get through. The outgoing UDP message shows a query ID (35084) with DNS query flags ("A?"), confirming it was a standard DNS request. The ICMP error suggests the DNS server is likely down or not responding.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

At 1:24 p.m. today, customers reported seeing “destination port unreachable” when trying to access **yummyrecipesforme.com**. The cybersecurity team is investigating to restore access. Packet captures using **tcpdump** showed DNS port 53 was unreachable. The next step is to determine whether the DNS server is down or if firewall rules are blocking traffic. Possible causes include a DNS server outage from misconfiguration or a Denial of Service attack.
